

Probabilistic Precipitation Nowcasting with the Short-Term Ensemble Prediction System in Belgium

Loris Foresti

Radar and Lightning Detection group,
Royal Meteorological Institute of Belgium, Brussels

*RainGain International Workshop on “Fine-scale Rainfall Nowcasting”,
Antwerp, 31 March 2014*

PLURISK objectives

- Quantification, forecasting, warning, control and management of **urban pluvial floods**
- Typical **response times** of urban catchments and sewer systems: **10-60 minutes**
- PLURISK WP1: **nowcasting**
 - Nowcasting of fine-scale extreme rainfall using C-X band radar data, NWP outputs and lightning data
 - **INCA-BE** system provides **deterministic** nowcasts
 - **Probabilistic nowcasting** from an **ensemble** of scenarios?
 - High resolution and frequently updated ensemble rainfall nowcasting **not possible with NWP**

	Nowcasting	NWP ALARO
Spatial resolution	1-2 km ²	4 km ² x 5
Temporal resolution	5-10 min	1 hour
Update cycle	5-10 min	6 hours
Computing time	< 5-10 min	4 hours (+spin-up)

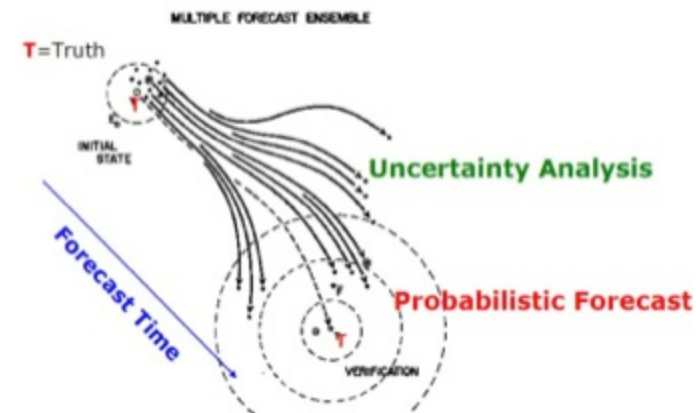

Ensemble/probabilistic nowcasting?

- **Nowcasting: very-short term forecasting** of weather (0-6h)

	Nowcasting	NWP ALARO
Spatial resolution	1-2 km ²	4 km ² x 5
Temporal resolution	5-10 min	1 hour
Update cycle	5-10 min	6 hours
Computing time	< 5-10 min	4 hours (+spin-up)

- Nowcasting of precipitation strongly driven by the **extrapolation of radar images**
- The **INCA-BE** nowcasting system at RMI provides **deterministic precipitation nowcasts**
=> what is the **forecast uncertainty?**

- **Ensemble nowcast**: possible set of weather scenarios
- **Probabilistic nowcast**: proportion of the ensemble exceeding a given threshold

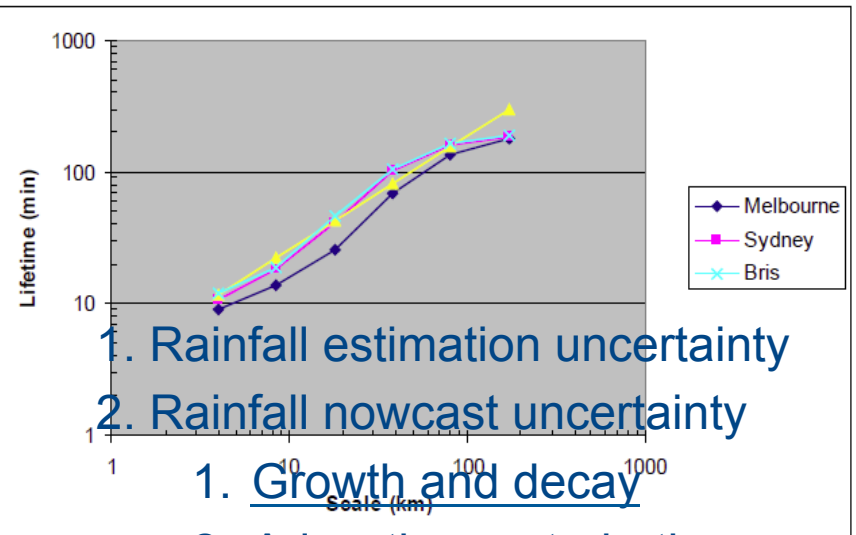

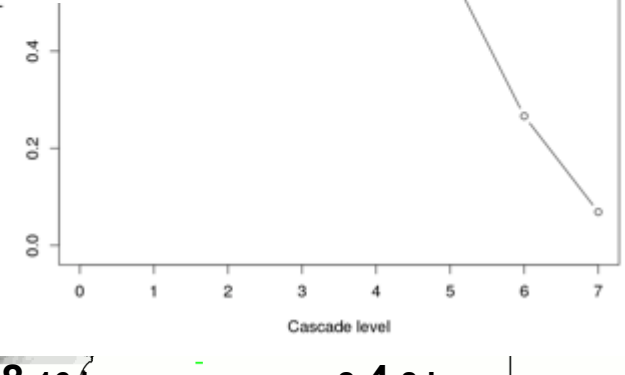

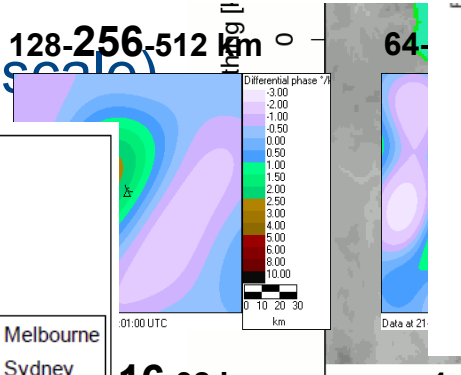

Heuristic probabilistic rainfall nowcasting

Approach		Pros	Cons
<p>Deterministic nowcast post-processing</p> <p><u>Raincast</u> (Schmid et al., 2000) <u>MAPLE</u> local Lagrangian approach (Germann and Zawadzki, 2003)</p>		<ul style="list-style-type: none"> - No need to explicitly generate ensembles - Easy to implement on deterministic systems 	<ul style="list-style-type: none"> - Underestimation of forecast uncertainty - Non-independent “ensemble members”
<p>Analogue approach</p> <p>Radar sequence retrieval (Otsuka et al., 2000) <u>NORA</u> (Panziera et al., 2012; Foresti et al., 2013)</p>		<ul style="list-style-type: none"> - Analogues have good space-time properties - Better uncertainty quantification 	<ul style="list-style-type: none"> - Low forecast skill (no Lagrangian persistence) - Extreme events never seen before?
<p>Stochastic approach</p> <p><u>Space-time multifractals</u> (Marsan et al., 1996; Macor et al., 2006) <u>S-PROG</u> (Seed, 2003) <u>STEPS</u> (Bowler et al., 2006); <u>SBMcast</u> (Berenguer et al., 2013)</p>		<ul style="list-style-type: none"> - Elegant statistical framework - Exploits Lagrangian persistence - Independent and equally likely ensemble members 	<ul style="list-style-type: none"> - Mathematical complexity of some models - Need to integrate more meteorological knowledge

Short-Term Ensemble Prediction System

1. Estimation of **advection** using optical flow on radar images
2. **Spatial scaling** (FFT decomposition of rain field)
3. **Dy** (rainf

1. Rainfall estimation uncertainty
2. Rainfall nowcast uncertainty

Small scales **Large scales**
Realistic space-time properties and scale-dependent life-time of rainfall features adapted in real-time

STEPS stochastic nowcast

- 20 stochastic ensemble members
- Observation and forecast uncertainty

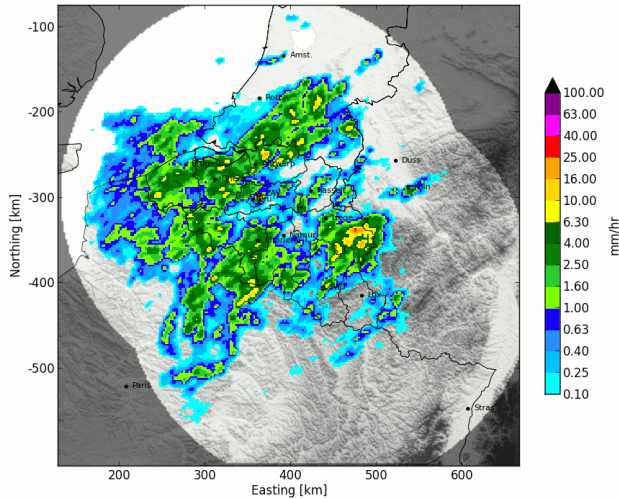

- **Analysis** = radar observations = quantitative precipitation estimation (**QPE**)
- **Nowcast** = radar extrapolation = quantitative precipitation forecast/nowcast (**QPF/QPN**)

STEPS probabilistic nowcast

Wed Oct 3 15:00:00 2012 + 5 min
Wed Oct 3 15:05:00 2012 nowcast

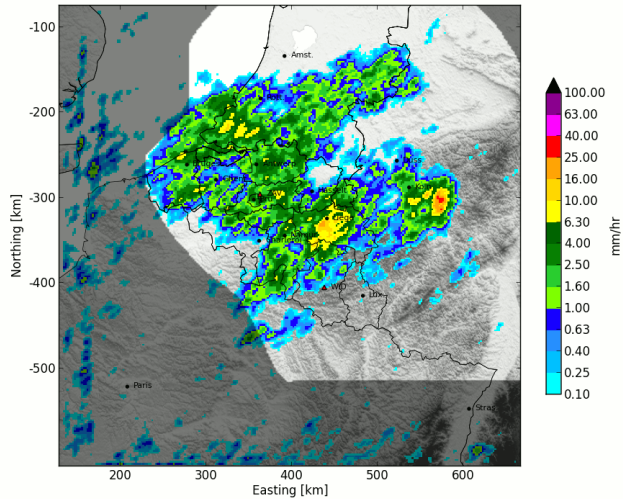

member 0

accumulation: 5 min

Wed Oct 3 15:00:00 2012 + 120 min
Wed Oct 3 17:00:00 2012 nowcast

member 0

accumulation: 5 min

Wed Oct 3 15:00:00 2012 + 5 min
 Wed Oct 3 15:05:00 2012 nowcast

probability ≥ 5.0 mm/hr

accumulation: 5 min

Wed Oct 3 15:00:00 2012 + 120 min
 Wed Oct 3 17:00:00 2012 nowcast

probability ≥ 5.0 mm/hr

accumulation: 5 min

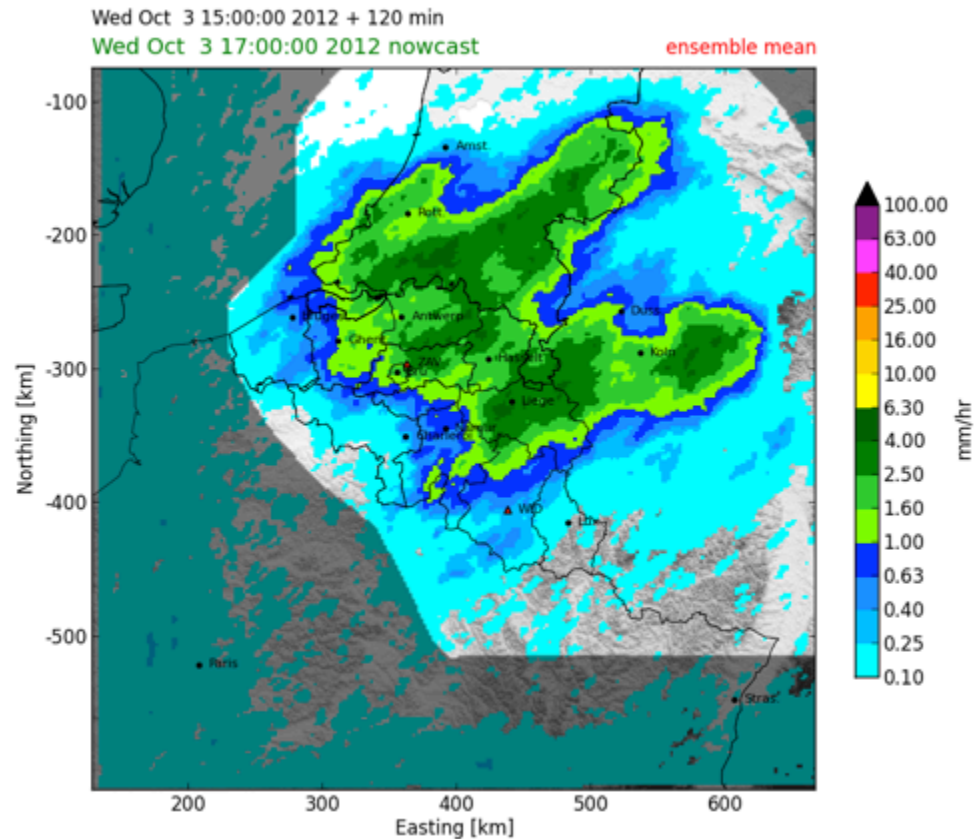

% ensemble members

\geq

rainfall
 threshold
 (equivalent
 5.0 mm/hr)

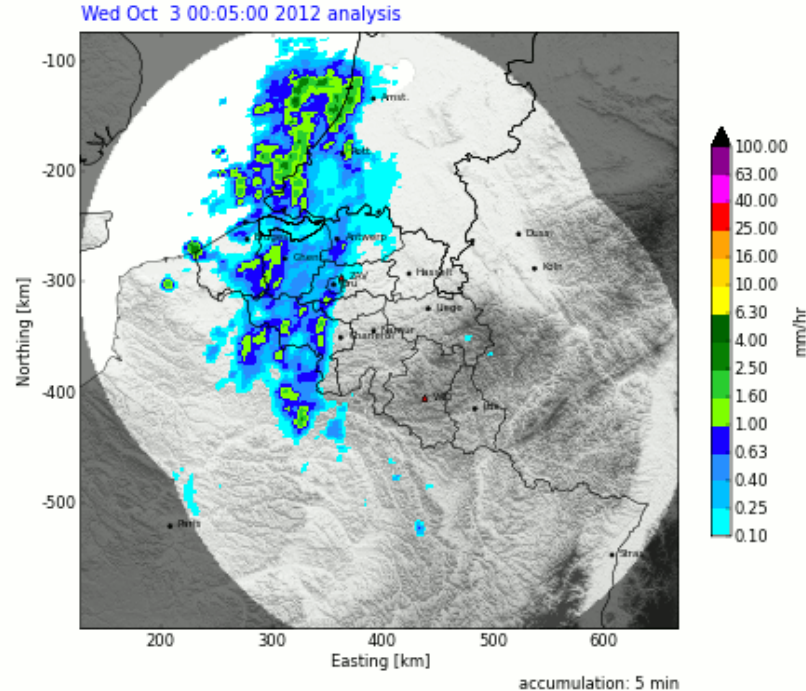

STEPS ensemble mean

- Average of ensemble members
- “**Deterministic**” quantitative rainfall nowcast
- Accounts for loss of predictability (unpredictable features are smoothed out)

PLURISK case study: 3 October 2012

- One nowcast issued every 5 minutes over the day
(total = 288 ensemble nowcasts)
- 256x256 domain at $2 \times 2 \text{ km}^2$ spatial resolution
- Nowcast of 5 and 30 minute rainfall accumulations up to +2 hours lead time
- Roughly 1-2 minutes computational time per nowcast

Forecast verification

Why verify?

- **Monitor** forecast skill over time
- **Diagnose** forecast errors
- **Compare** different models
- **Predict** the forecast accuracy

Period start: 20121003000000
Period end : 20121003235500

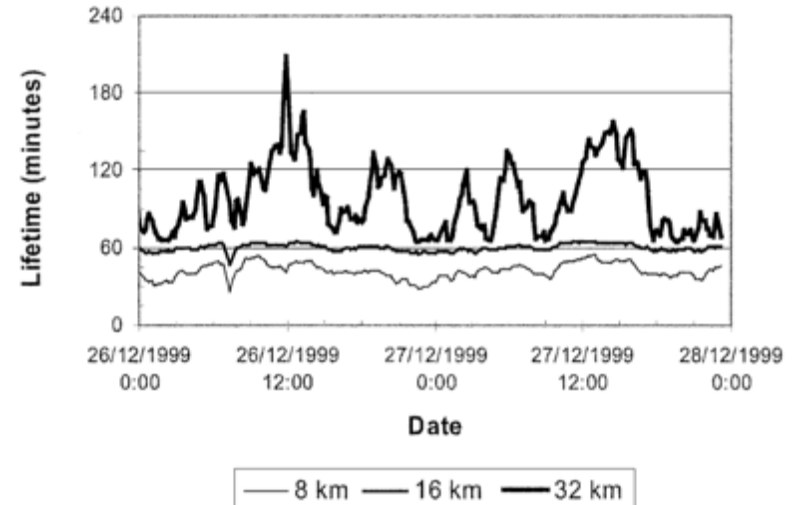

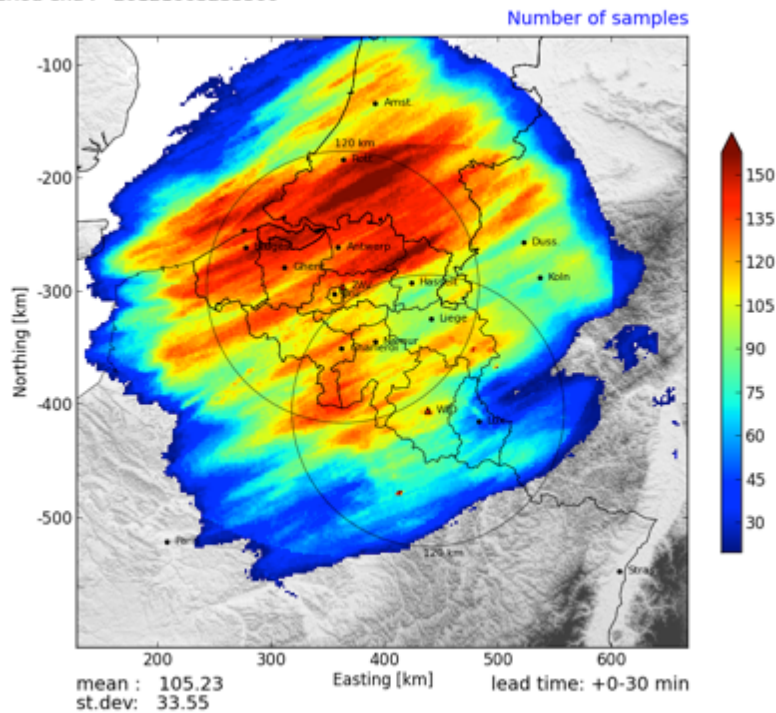

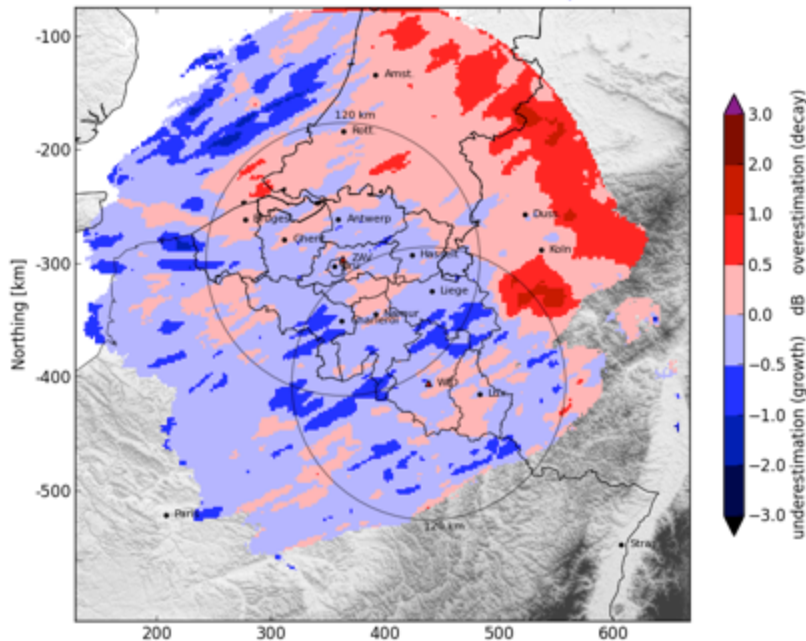

FIG. 7. Time series of the Lagrangian autocorrelation lengths for 8-, 16-, and 32-km-scale structures.

- Forecast errors are highly variable in space and time
- **Number of samples** is much higher in space (nr. pixels) than time (nr. time steps / forecasts)

Continuous verification (bias)

Period start: 20121003000000
Period end: 20121003235500

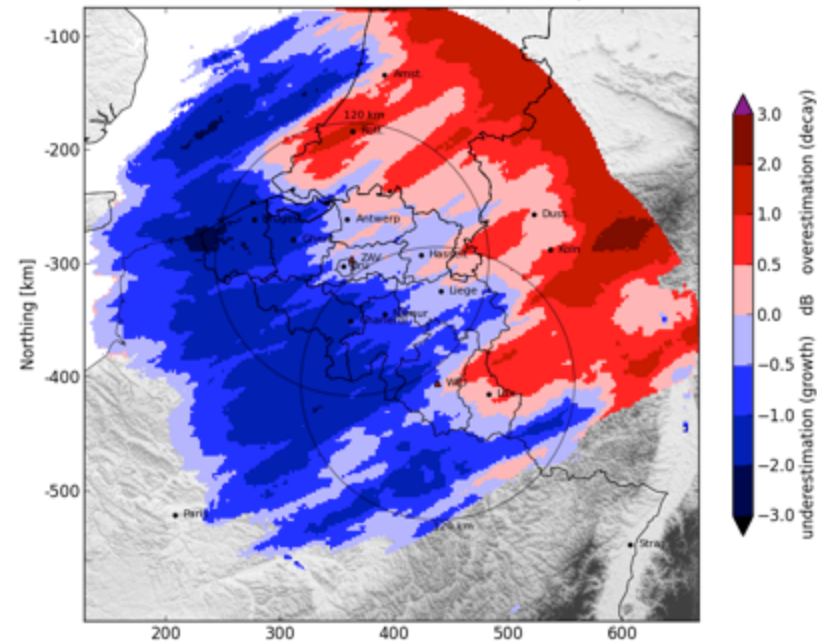

Multiplicative bias

mean: -0.10 Easting [km] lead time: +0-30 min
st.dev: 0.29

Period start: 20121003000000
Period end: 20121003235500

Multiplicative bias

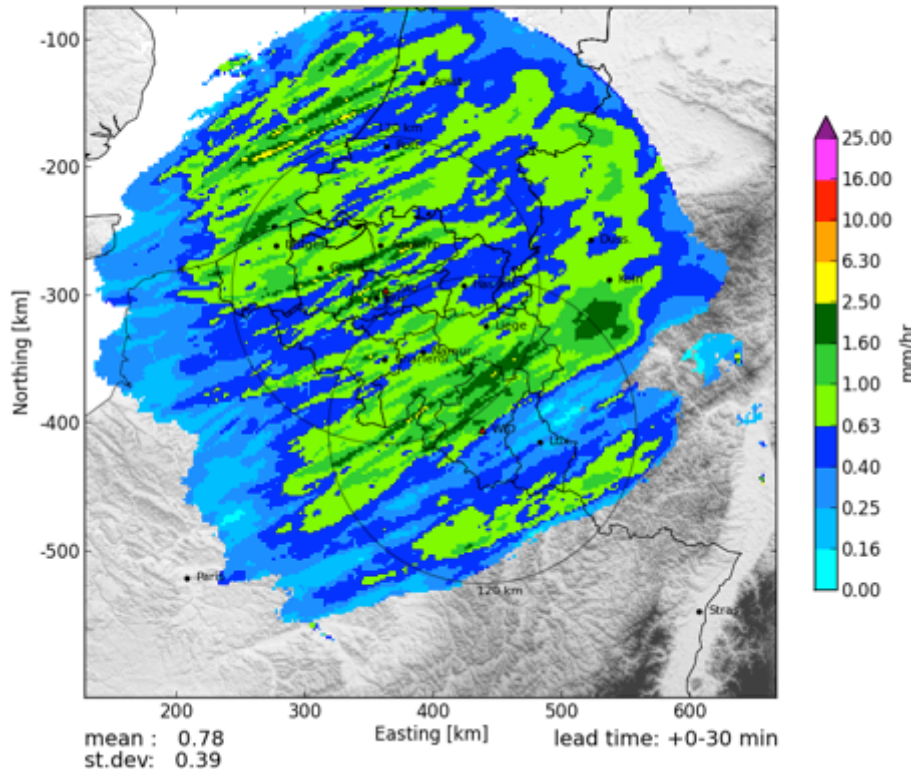

mean: -0.44 Easting [km] lead time: +90-120 min
st.dev: 0.70

$$\text{Multiplicative bias} = 10 \log_{10} \left(\frac{\text{Forecast} + 2 \text{ mm hr}^{-1}}{\text{Radar} + 2 \text{ mm hr}^{-1}} \right)$$

Continuous verification (Nash-Sutcliffe)

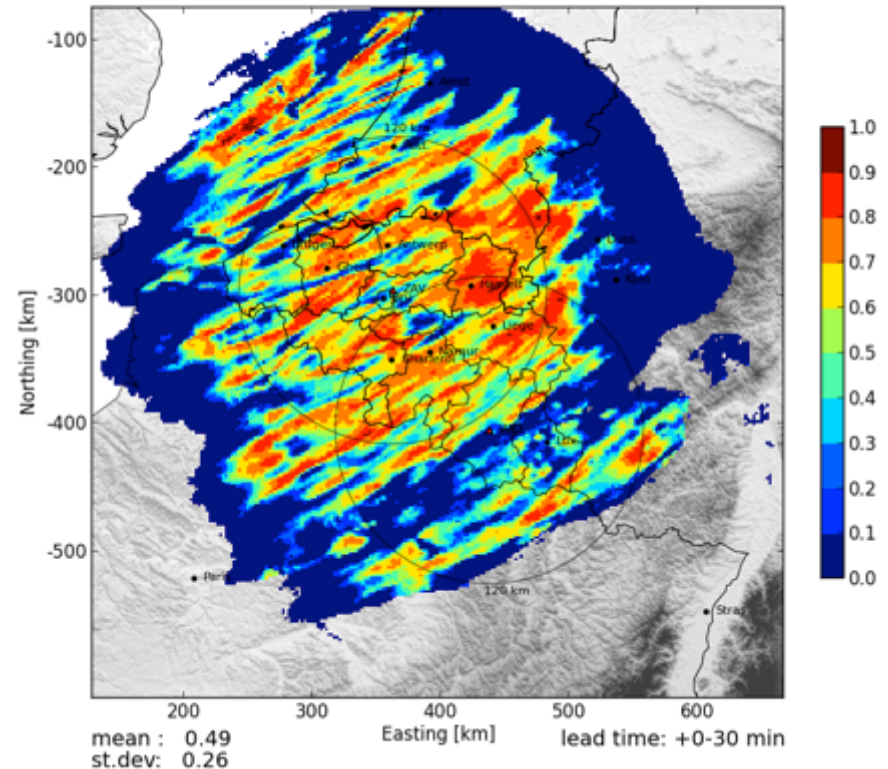

Period start: 20121003000000
Period end: 20121003235500

Root mean square error

Period start: 20121003000000
Period end: 20121003235500

Nash-Sutcliffe efficiency

$$\text{Nash-Sutcliffe efficiency} = 1 - \frac{\text{RMSE}\{\text{Forecast}, \text{Radar}\}}{\text{Var}\{\text{Radar}\}}$$

Categorical verification (POD-FAR)

Period start: 20121003000000
Period end: 20121003235500

Probability of detection, $R \geq 0.1$ mm/hr

Period start: 20121003000000
Period end: 20121003235500

Probability of detection, $R \geq 0.1$ mm/hr

Period start: 20121003000000
Period end: 20121003235500

False alarm ratio, $R \geq 0.1$ mm/hr

Period start: 20121003000000
Period end: 20121003235500

False alarm ratio, $R \geq 0.1$ mm/hr

$$POD = \frac{\text{hits}}{\text{hits} + \text{misses}}$$

- What fraction of the observed events was correctly forecast?

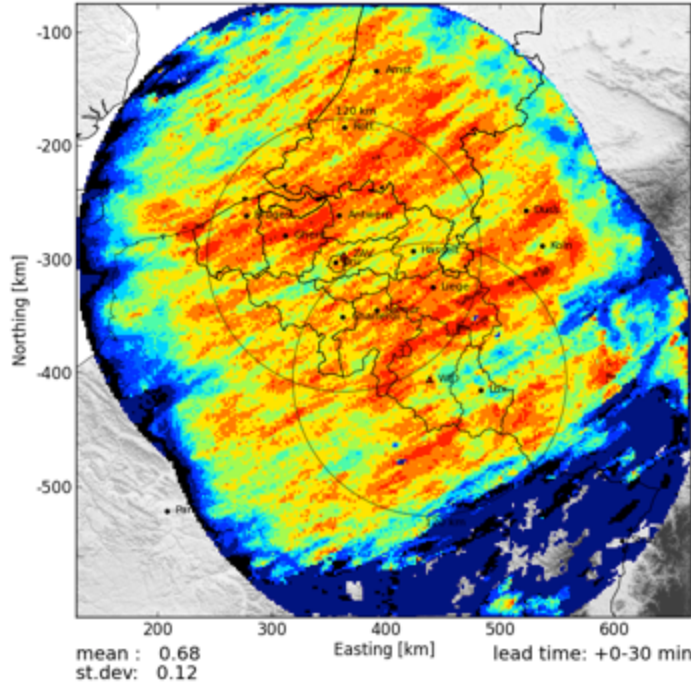

$$FAR = \frac{\text{false alarms}}{\text{hits} + \text{false alarms}}$$

- What fraction of forecast events actually did not occur?

Categorical verification (GSS)

Period start: 20121003000000
Period end: 20121003235500

Gilbert skill score, $R \geq 0.1$ mm/hr

Period start: 20121003000000
Period end: 20121003235500

Gilbert skill score, $R \geq 0.1$ mm/hr

$$ETS = \frac{hits - hits_{random}}{hits + misses + false\ alarms - hits_{random}}$$

- GSS = Gilbert Skill Score = ETS = Equitable Threat Score
- How well did the forecast events correspond to the observed events (corrected by random chance)?

Categorical verification (HSS)

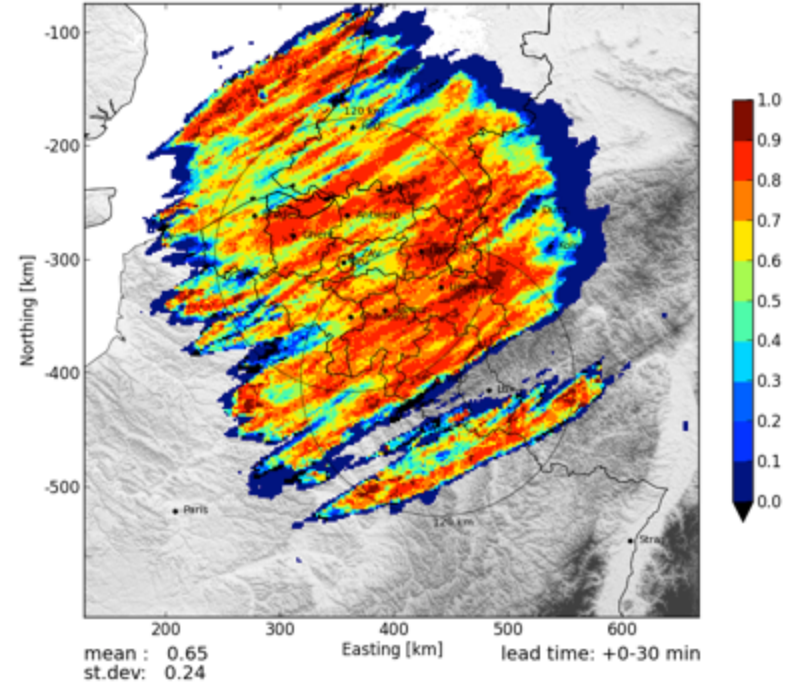

Period start: 20121003000000
Period end : 20121003235500

Heidke skill score, R >= 0.1 mm/hr

Period start: 20121003000000
Period end : 20121003235500

Heidke skill score, R >= 2.0 mm/hr

$$HSS = \frac{(hits + correct\ negatives) - (expected\ correct)_{random}}{N - (expected\ correct)_{random}}$$

- HSS = **Heidke Skill Score** = Cohen's kappa index
- What was the accuracy of the forecast compared with random chance (both events and non-events)?

Probabilistic verification (Reliability)

Period start: 20121003000000
Period end: 20121003235500

Reliability: agreement between forecast probability and observed frequency

Resolution: ability of the forecast to distinguish situations with strictly different observed frequencies

Sharpness: ability to forecast probabilities near 0 or 1

Probabilistic verification (Reliability)

Period start: 20121003000000
Period end : 20121003235500

Reliability diagram, rainfall ≥ 5.0 mm/hr

- **Reliability**: agreement between forecast probability and observed frequency
- **Resolution**: ability of the forecast to distinguish situations with strictly different observed frequencies
- **Sharpness**: ability to forecast probabilities near 0 or 1

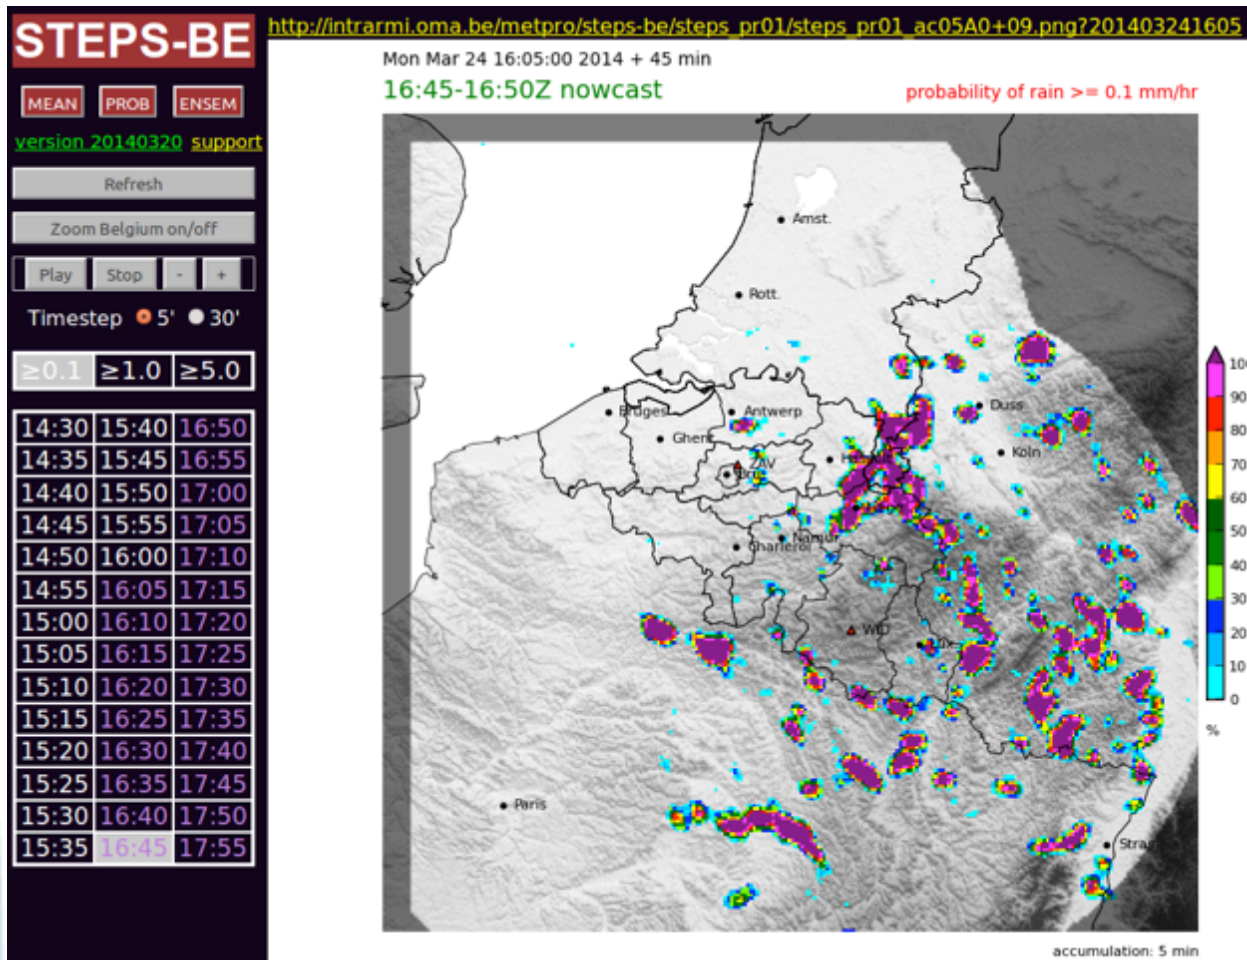

Probabilistic verification (ROC)

Period start: 20121003000000
Period end : 20121003235500

- **Discrimination:** ability of the probabilistic forecast to discriminate between events and non-events
- **Hanssen and Kuipers discriminant (Peirce's skill score):** maximization of hits and minimisation of false alarms
- **Area under the ROC curve**

Next STEPS...

- Real-time test
- Running case studies on re-analyzed radar archive (ground clutter and VPR correction)

- Rain gauge calibration of the multiscale QPE ensemble
 - Ensemble rainfall QPE/QPF => ensemble hydrological nowcasts.
- Added value?

Beyond the next STEPS

- Multiscale velocity field estimation
- Spatial and temporal variability of cascade parameters
- Integration of growth and decay via bias correction
- Time-lagged ensemble members for probabilistic nowcasting

Computational time

Generation of the stochastic noise cascade with FFT is slow

More important to have **higher resolution** or **large ensembles**?

Rainfall not predictable at 500 m² at 5 minute resolution

Grid	Resolution [km]	Nr. members	Nr. lead times	Time [minutes]	
256x256	2	1	36	0.1
